

Where every open design question stands

Eight items were raised on 27 July 2026. This is what each one turned out to be, what was designed against it, and what has to be decided before anything is built. **Nothing in the app was changed.** Five new sketches were written; the code was read, not edited.

THE EIGHT ITEMS AT A GLANCE

#	ITEM	STATE	WHERE IT LIVES	WHAT IS NEEDED
1	Assets balance value	NEW SKETCH	sketch 155	pick 1 of 5
2	Balance + compute panel	DECIDED, UNBUILT	sketches 016 / 017 / 018	schedule a phase
3	Transaction drawer	AWAITING PICK	sketch 154	pick 1 of 5
4	Drawer colours	NEW SKETCH	sketch 156	pick, then walk
5	Coin page	HALF DECIDED	152 done · 061 open	pick chrome, 1 of 5
6	Receive drawer	NEW SKETCH	034 decided · 159 new	finish the decision
7	Buy GNUS	DEFECT FOUND	sketch 157	routing fix + pick
8	Floating swap button	NEW SKETCH	sketch 158	pick placement + skin

THE ONE THING WORTH KNOWING BEFORE ANYTHING ELSE

The button labelled "Buy GNUS" does not open a buy screen. `coins_screen.dart:349` pushes `/buy`, and `router.dart:80` maps `/buy` to the order *history*. The screen that actually buys something sits at `/createOrder`, reachable only through a small "+ New Order" text action. A user with no orders taps a gradient CTA promising a purchase and lands on "**Total Orders: 0 / No orders found.**" - which is the screenshot. This is a one-line routing fix and it is worth more than every other item on this list.

HOW TO OPEN THE NEW WORK

```
open .planning/sketches/155-assets-balance-value/index.html
open .planning/sketches/156-drawer-canvas-colour/index.html
open .planning/sketches/157-buy-gnus-page/index.html
open .planning/sketches/158-global-fab-placement/index.html
open .planning/sketches/159-receive-drawer/index.html
```

Each has a README beside it with the findings, the variants, and an explicit recommendation with a runner-up and a rejected option. Every sketch renders clean in headless Chrome; each carries its own Light/Dark toggle and state switches.

Numbers 155-159 are design lane B (150-199), per the parallel-session rule in CLAUDE.md. The MANIFEST row for each sketch is written at the bottom of its README, ready for the executor to append - a design session does not write the shared manifest.

What each one turned out to be

1

The Assets balance value

SKETCH 155

Asked: *five designs for the balance figure in the Assets panel - "wyglada srednio".*

What it is today: `coins_screen.dart:258-284` - a 20px/w700 total over `+$82.91 · +1.36%`, both crammed into the trailing slot of a 44px section-title row.

THREE FINDINGS, FROM THE CODE

- **The same dollar figure is printed twice on that row, from two different sources.** The left card shows `selectedWalletBalance` (the wallet's own balance); the Assets header shows `assetsTotal()` (a CoinGecko fold). Both carry a `$`, neither says what it is. They match in the dev mock because one injector sets both. Nothing makes them agree in production.
- The two-line column is centred in a **44px** row and needs ~42px, so it is wedged edge to edge - which is most of the "wyglada srednio".
- The delta joins a **rate** and an **amount** at equal weight with a literal mid-dot, flooded with one colour.

VARIANTS 0 Today · A Value + chip · B Eyebrow stack · C Sparkline · D Balance band · E Quiet ledger

Recommendation: A · Value + chip. The % becomes a filled pill matching the `+3.20%` pills in the rows directly below it, the dollars go quiet grey, the cents drop to 54%, and "today" replaces the mid-dot. Smallest diff that fixes all three findings. **Runner-up D · Balance band** - structurally better, but only take it if the left card is being restructured too (sketch 016), otherwise two hero balances sit 12px apart. **Rejected C · Sparkline** - there is no portfolio time series in this app; it would have to be faked.

2

The balance + compute panel

DECIDED 2026-07-22, NEVER BUILT

Asked: *where do we stand with this part - open everything we did there.*

Three sketches cover this panel and **all three have chosen winners. None of them has been built.** What is on screen today is still the pre-design card.

SKETCH	QUESTION	WINNER
016 compute-panel-anatomy	How does the card split into Balance + Compute in the 276px it has?	B2 · Twin tiles - fits at 261px worst case, +15px headroom
017 compute-status-states	What status component is honest across all nine states?	A · Dot + label - the ring is kept only for the 56px FAB
018 job-request-flow	What does requesting a job look like as a flow?	A · Drawer, vertical steps - <code>/submit_job</code> stays as the full-screen host

WHY IT MATTERS THAT THESE ARE UNBUILT

- **The 52.5% is a lie, and it was measured.** Over 161 polls across 40s the value reaches 0.525 at t=10.6s and never changes again. A determinate ring promises it will reach 100. It does not.
- **The silent death.** Any exception from `getProcessingStatus()` cancels the timer **permanently**; nothing restarts it. The UI then shows "idle" in grey - pixel-identical to a healthy node with nothing to do.
- **The zero-balance red.** "No funds available" renders in `statusError`. An empty wallet is not a broken wallet.

Nothing new to decide here. The designs are chosen and documented, including an affordance audit that names the **three code changes** they need (a stall detector, a restartable processing timer, and a public `AccountDrawer.show`). This is a **planning** item, not a design one: it wants a phase of its own. It also interacts with item 1 - if 016-B2 lands, the balance-band variant becomes available for the Assets header.

3 The transaction details drawer

SKETCH 154, AWAITING YOUR PICK

Asked: *bring it to our standards - or does it just copy the other new drawers?*

It copies them, and the sketch already exists. Sketch 154 was written 26 July with five variants and a recommendation. No new design was needed today.

- The receipt shape was decided by **031-B1 "Pill + sections"**; the shell by **030-B1 "Quiet band"**. Neither ever reached this drawer.
- `_buildDetailsCard` has **vertical padding only**, so labels touch the panel's left edge and values slam its right edge.
- `_statusPill` is already written and already correct for all four states - the drawer just does not call it.
- **Three computed fields are thrown away on every open:** the fiat value line, the exact unclamped amount, and the context subtitle. All three are returned by the same `txRowContent()` call the drawer already makes.

Recommendation: A · 031-B1 as decided, and take **D · Copyable**'s tap-to-copy rows with it. This panel has been designed twice and ported zero times; picking a third shape would be the mistake. **Rejected C · Banner** - alarm chrome on the happy path; borrow only its reason sentence for the Failed and Cancelled states.

4 Drawer colours

SKETCH 156

Asked: *the drawer is fine, but the colours - it should be darker and more compatible with the rest.*

That reading is correct, and it has a measurable cause.

SURFACE	TOKEN	VALUE
The page	<code>surfaceBase</code>	#0B0D12
Every card	<code>surfaceElevated</code>	#0C0E14
Every drawer	<code>surfaceMenu</code>	#171A21 - two steps lighter, and the only large surface at that value

- **The input field is painted the same colour as the panel it sits on.** The drawer passes `gw.surfaceMenu` as the field background, and the panel is already `surfaceMenu`. Fill contrast: **1.00:1**. It is not a box, it is a hairline.
- That hairline is white at 12%, which measures **1.43:1** against its own canvas. WCAG 1.4.11 asks for **3:1** when a border is the only thing identifying an input. **White at 30% is the first step that clears it.**
- Two dark fills can never carry the boundary alone (#171A21 on #0C0E14 is 1.11:1), so the answer has to be a pair: darker panel **and** stronger field edge.

Recommendation: A · Card canvas - panel down to `surfaceElevated`, field up to `surfaceMenu`, field edge to white 30%. Answers both halves of the request in one move, and it is **one line** in `responsive_drawer.dart`. **That one line is also the whole risk** - it re-skins all ~19 drawers, and ~17 of them are unwalked since the header change. It should ride the drawer walk that is already queued, not precede it. **If the walk slips, take C · Sunken field** - single-drawer scope, fixes the 1.00:1 outright, and does not block A later.

5 The coin page

INSIDE DECIDED, CHROME OPEN

Asked: *where do we stand with the design, to be finished.*

Two sketches, one answered and one not:

SKETCH	SCOPE	STATE
104	The page structure, first pass	superseded by 152
152	What is <i>inside</i> the page, responsively	DECIDED and implemented - A at ≥ 768 (two panels), D below (unified stack). Convert is read-only, no 1H/1D/1W tabs (there is no per-range fetch), Send and Swap disabled
061	The page's <i>chrome</i> - frame, header, navigation	OPEN - five variants drawn, recommendation written, no pick

WHAT 061 FOUND

- **This page has no navbar.** `/token-info` sits outside `ShellRoute`, so from a coin you cannot reach any tab without going back. Every other page is inside the shell.
- It uses a Material `AppBar` with a breadcrumb instead of `GWPageHeader`, and a **centred 1200** frame where every tab uses **1536 with a 12px gutter** - so its title sits ~ 170 px off the app's own left axis.
- **The model carries far more than the page shows.** Four fields are rendered; `marketCapRank`, `high24h` / `low24h`, `fullyDilutedValuation`, `ath` / `athChangePercentage`, `maxSupply` and more are already in Hive, unused, with no new request needed.

Recommendation: 061-A · In the app frame - the route returns to `ShellRoute`, a " $\leftarrow$ Markets" chip replaces the breadcrumb, the coin identity becomes a `GWPageHeader` with the price in its trailing slot, frame 1536. Inside stays exactly as 152 decided. **Runner-up B · Stat bar** adds the KPI tiles from the unused fields - take it after A, as content, not as a rival layout. **Note:** the missing-navbar defect is the same one found on the Buy GNUS routes (item 7). If both are fixed, fix them together - it is one `ShellRoute` edit.

6 The Receive drawer

SKETCH 159

Asked: *Receive design - with a screenshot and no further words.*

So the sketch answers the unasked question first: **is this what was decided?** Mostly. Sketch **034 round 2** chose **A2 "Grouped address"** and two of its four parts shipped.

- **Drift:** the 4-character chunked address shipped as a **middle truncation** (`0x9fF8C9...262e2b`). Chunks were chosen precisely because a receive address is the one string a user eyeball-verifies against another screen, and truncation hides the 26 middle characters.
- **The drawer body has zero horizontal padding**, so the amber network warning runs to both panel edges. Same defect class as the transaction drawer in item 3, and the same fix location.
- **A blank network name produces broken copy:** "Only send **-network** assets to this address."
- `AssetImage("")` is constructed for the QR's centre image when the network has no icon.
- **Two things are right and must not be touched:** the QR keeps a solid white backing in both appearances so a phone camera can read it, and the amber uses a darkened light-mode value because the warning token fails as text on white.

Recommendation: A · A2 as decided - finish the standing decision: 20px body padding, 4-char chunks in a labelled card, QR in a rounded white tile, Copy in the footer where every other drawer's primary action lives. **Build the chunking as one small component** - sketch 154-D needs the same thing, so one widget pays for two sketches. **Rejected D · Compact** - it un-boxes the one warning standing between a user and a permanent loss of funds.

Asked: full redesign of this page - analysis of what is there, what the logic is.

The flow, end to end: Buy GNUS → /buy (order history) → "+ New Order" → /createOrder (the form) → Get Quote → Create Order → /checkout or /checkoutQR → geniuswallet://banxa/callback → OrderDetailsPage (polls) . Seven routes, **all outside the navbar shell**.

FOURTEEN DEFECTS WERE FOUND. THE ONES THAT MATTER MOST:

- **1. The CTA lies** - "Buy GNUS" opens the order history (see the callout on page 1).
- **2. The customer id is a placeholder** - `fetchOrders('your-cust-id')` , hardcoded at two call sites. **The list cannot show a real user's orders in any build.** "Total Orders: 0" is a stub, not an empty account.
- **3. Three conflicting status vocabularies.** The filter offers six values, the colour switch handles five, the banner handles three. `inProgress` and `expired` get no colour; `cancelled` gets a colour but cannot be filtered.
- **4. No design tokens at all** - raw `Colors.green/orange/red/grey` . Nothing on this page flips with the appearance.
- **5. The empty state reads as a failed load** - two bare strings over an empty page.
- **9. Real data thrown away** - `processingFee` , `networkFee` , `transactionHash` and `walletAddress` are all parsed and none are shown. A completed purchase cannot be opened in an explorer although its hash is in hand.
- **14. KYC is an unlabelled icon** with no state - and a fiat purchase can fail on exactly that.

THE CONSTRAINT, AND THE WAY THROUGH IT

CLAUDE.md : "Files under /banxa and /squidrouter are auto-generated. Do not change them." **Six of the seven screens live there.** Taken literally, no redesign is possible.

They can all be built anyway, because the generated code is layered: models, service and cubits are **data**; only three files are **presentation**. New widgets can live under `lib/screens/` - where the buy form already lives, outside the fence - subscribe to the same cubits, and the router repoints to them. **The generated files stay byte-identical and simply stop being mounted. Zero edits inside the fence.** Worth confirming with Braian whether that note is still true or stale.

Recommendation: A · Buy first, plus E · Orders fixed - not rivals. A decides what `/buy` is; E decides what the history *looks like*. In value order: **(1)** repoint `/buy` , **(2)** put the Banxa routes inside `ShellRoute` , **(3)** fix the customer id - until it is real, no list design can be judged - **(4)** then the list rebuild. **Runner-up D · Stepper** beats A if KYC turns out to branch for most users, which is a product fact nobody has yet. **Rejected C · Drawer** - a purchase with limits, an expiring quote and a third-party handoff does not fit in 420px.

Asked: *change its location - the bottom and right gaps are not equal. Propose a design, and make one where only the outline is the gradient.*

The gaps are 20 and 80 - `global_swap_fab_host.dart:124-128` is literally `right: space10` (20) and `bottom: 80`. Not a rounding slip: two numbers chosen for two reasons, and one of the reasons does not apply here.

- The comment says the 80 "clears the 60px bottom nav". That nav is mounted **only by MobileOverlay**. The desktop app has no bottom bar at all - so 60 of those 80 pixels are avoiding something that is not there.
- The two glows are offset 6px downward with a 24px blur, so the visible mass hangs ~30px below the box - which does not rescue the gap, and means the glow is clipped on the right at 20px while having 80px of room underneath.

THE GRADIENT OUTLINE - THE ONE TECHNICAL FACT

A `BorderSide` takes a single `Color`. No Flutter border can be a gradient - which is exactly why `GWFocusRing` was built during Phase 20. A gradient-outline FAB is a gradient-filled circle with an inset circle of surface colour on top. Two consequences, both drawn in the sketch: **(a)** the hole is a specific surface colour, so the FAB stops being canvas-agnostic - over a card and over the mesh it reads as a disc of the wrong shade; **(b)** the glyph colour must change, since the brand mint measures ~12:1 on the dark canvas but ~1.6:1 in light mode.

Recommendation - placement: P1 · Equal gutter. Derive the number instead of hardcoding it: `space10 + (isDesktop ? 0 : 60) + bottomInset`, using the same breakpoint `ResponsiveDrawer` already uses. Mobile keeps exactly today's 80. **Rejected P3 · optically equal** - it hardcodes compensation for a shadow offset, so retuning the glow silently un-centres the button.

Recommendation - skin: S1 · Gradient ring, but judge it on the three canvases first. If the hole reads as a hole in a card, **S2 · ring + tint** is the same idea with the failure removed - take it without a second round. **Rejected S3 · glass** - a permanent `BackdropFilter` above the Navigator on every screen.

Found while measuring: the FAB is hidden on `/checkout`, `/checkoutQR`, `/kyc` and `/banxa/callback` - but **not** on `/buy`, `/createOrder` or `/orderDetails`. So the swap button floats over the fiat purchase flow. Product question, raised in sketch 157.

Where the project stands tonight

Everything below predates today and is unchanged by this session.

IN FLIGHT

THING	STATE
PR #216	Open, branch <code>redesign/jakub-260726b</code> . Five commits: centred <code>GWPageHeader</code> + gradient focus ring, swap form polish, the settings-form drawer archetype (063-A) + list picker (032-A1), the Phase 20 feedback page frame (153-B) + the 064-B gradient underline, and the planning record. Gates: <code>flutter analyze lib</code> = 59 (baseline ≤61); <code>flutter test</code> = 323 pass / 1 fail, the failing one being a <code>main()</code> -less stub that predates this work.
Phase 20	Feedback page frame - executed and summarised. <code>20-VERIFICATION.md</code> still owed: the SDK-running rail rows, the Failed status string, light mode and the send path.
Phase 08	Swap and bridge - 08-01 to 08-04 committed. 08-05 Tasks 1 and 2 remain: the receipt wiring in <code>swap_screen.dart</code> and deleting three superseded swap drawers. Task 3 is marked superseded and must not be run.
Uncommitted	Two cmake files only - held out of PR #216 deliberately. Build-environment work, not redesign work; should land on its own.

THE BLOCKER THAT WAS ALREADY QUEUED FOR TONIGHT

~17 drawers have not been looked at since the shell header changed. The title went 16px/w500 to 18px/w600, `titleSpacing` 16 to 20, and the toolbar 48 to 56 - a change with a blast radius of about nineteen drawers, of which only Swap Settings and the Token Selector have been seen. The rest (Select Network, Select Account, the dApp approvals, the Banxa receipts, "More Options", Receive) are unwalked. **Item 4 in this document lands on exactly the same nineteen panels**, so the sensible order is: walk with today's colours, record the whole list, then apply the colour change and re-walk the same list.

TWO DEFECTS THAT ARE THE SAME DEFECT

Zero body padding in drawers. The shell passes `body: child` straight through and adds no padding, although 030-B1 specified 20px for every drawer. It shows up in the transaction drawer (item 3), in the Receive drawer (item 6), and potentially in any of the other seventeen. **Fix it once, in `responsive_drawer.dart`, during the walk** - not three times in three callers.

Pages outside the navbar shell. The coin page (item 5) and all seven Banxa routes (item 7) sit outside `ShellRoute`, so none of them has the navbar. It is one edit, and it closes two items.

ALSO OPEN, NOT RAISED TODAY

Sketch **062** (swap page ledger) is awaiting a pick and carries a live bug: `swap_screen.dart:243` writes `fees: fromAmount` and the receipt renders it as "Network Fee", so the swap detail drawer shows a wrong number today. Sketch **040** (swap page header), **060**, **103** (markets page), **151** (news search), **025-030** (transactions page chrome) and **020** (boot mesh depth) are all drawn with recommendations and no pick. And it is still open whether **064-B**'s gradient underline rolls out to the transaction filter chips, the Markets timeframe tabs and the Web tab strip.

The decisions, and a suggested order

Eight picks. Each has a recommendation with a stated runner-up and a stated rejection, so a pick can be "yes" or a one-word substitution.

#	DECISION	RECOMMENDED	IF NOT THAT	SIZE
1	Assets balance treatment	155-A value + chip	155-D, but only with 016	S
2	Compute panel - schedule it	a phase for 016-B2 + 017-A + 018-A	defer, say so explicitly	L
3	Transaction drawer	154-A + D's copy rows	154-B ledger	M
4	Drawer colours	156-A card canvas, after the walk	156-C tonight, A later	S / walk
5	Coin page chrome	061-A in the app frame	061-B adds the KPI tiles	M
6	Receive drawer	159-A finish 034-A2	159-C adds the network picker	S
7	Buy GNUS	157-A + E, routing first	157-D if KYC really branches	L
8	FAB placement + skin	158-P1 + S1 (fallback S2)	P2 at 24px	S

A SUGGESTED ORDER FOR THE EVENING

1. **Repoint /buy** . One line, and it is the defect a user hits first. Nothing else on this list has that ratio.
2. **Fix the FAB gap** (158-P1). One expression, no blast radius, immediately visible.
3. **Do the drawer walk** - it was already tonight's first task, and items 3, 4 and 6 all land on the same nineteen panels. Record the whole list before fixing anything.
4. **Then the drawer trio together:** body padding in the shell (fixes items 3 and 6 at once), the colour change (item 4), the receipt (154-A) and the receive finish (159-A).
5. **Then the Assets header** (155-A) - self-contained, one call site.
6. **Then the ShellRoute edit** - it closes the navbar half of both item 5 and item 7.
7. **Buy GNUS and the compute panel are phases**, not evening tasks. Both want planning: Buy GNUS because the customer id has to become real before its list can be judged, and the compute panel because its three sketches name three bloc changes.

ONE THING TO CONFIRM WITH BRAIAN, NOT DECIDE ALONE

Whether lib/banxa/ is genuinely regenerated by a tool, or whether that note in CLAUDE.md is stale. It changes the size of item 7 substantially: if the fence can be lifted for the three widget files, the same design lands with a much smaller diff than re-hosting the UI in lib/screens/ .
